

Andre Lara

Mobile Engineer (iOS & Android)

andremateuslara@gmail.com | linkedin.com/in/andre-lara | <https://andredevlab.github.io/portfolio/>

I'm a Software Engineer and Mobile Lead with 9+ years of iOS experience and hands-on responsibility across native iOS and Android. I currently own the mobile tech direction and end-to-end delivery of a digital banking product, from product discovery, requirements, and architecture to implementation, code review, security, testing, observability, CI/CD, and App Store and Google Play releases. My background includes high-scale international products at Uber and Visual Blasters, as well as direct collaboration with CEOs, CTOs, product leadership, and cross-functional teams in fluent English. I'm an execution-focused, hands-on leader with strong ownership, system design, technical decision-making, code review, and mentoring skills. My core expertise is in Swift and iOS, complemented by Android development, modern mobile architectures, and AI-assisted engineering workflows using Codex, Claude, Gemini, and GitHub Copilot. Focused on product and code quality.

EDUCATION

- **BS Computer Science - Pontifical Catholic University of Paraná (2016 - 2020)**

Academic Research Scholarship:

- Computer Vision applied to pedestrian circulation tracking. (2018 - 2019)
 - IoT system based on smart contracts and software agents. (2017 - 2018)
-

WORK HISTORY

- **Lead Mobile Engineer ([iOS](#) and [Android](#)) – Trio: Conta para Empresas (Oct 2025 - current)**

Leading the development and launch of both native iOS and Android. Defined the mobile technical direction from the ground up, keeping both platforms aligned on architecture, layers, API contracts, business rules, security standards, testing strategy, observability, and release processes. Built the entire iOS app from scratch and remain hands-on across architecture, feature implementation, production readiness, security, and App Store releases. On Android, contribute directly to implementation and serve as the final technical reviewer for pull requests before they are merged, ensuring that changes follow the architecture and quality standards established for the mobile product. Own the mobile security and release lifecycle across both platforms.

Work on-site with the CEO and CTO, and hold weekly meetings with the Product Director and leaders from Design, Backend, and the Internet Banking web platform. When a new demand comes into Mobile, I lead requirements discovery and turn it into an executable plan by aligning cross-team into business rules, user flows, scope, dependencies, ownership, delivery timelines, and release. Collaborate with Support, Marketing, and Finance when product and release decisions require customer feedback, launch coordination, or assessment of operational and financial impact. Also responsible for interviewing engineers and supporting the growth of the mobile team. Currently releasing biometric authentication on both platforms. **Stack:** Swift/Kotlin, UIKit and SwiftUI/Jetpack Compose, Observation and Structured Swift Concurrency, Coroutines, Certificate Pinning and OWASP principles, APNs and FCM push notifications, silent pushes for app and widget state updates, Lock Screen and Home Screen widgets, watchOS, Instruments, Sentry, Crashlytics, Amplitude, architecture diagrams and ADRs, CI/CD automation, XCTest, XCUITest, Espresso, unit tests, UI tests, and screenshot tests.

- **Senior iOS Engineer – [FlipaClip](#) - Visual Blasters (May 2023 to Jul 2025)**

Collaborated directly with the CEO and cross-functional teams to drive company growth, reaching over 5.1M monthly users. Implemented and maintained mobile SDK integrations for monetization, analytics and user engagement, including MoEngage, Amplitude and Purchasely. These initiatives supported subscriptions, ads, paywalls, user segmentation, and lifecycle messaging, contributing to a +154% revenue increase over two years. Responsible for maintaining, planning and developing features such as Color Picker, Segment Anything (AI), Text-to-Speech and Voice Cloning (AI), and the User Data Collection Squad. **Stack:** Swift, Objective-C, pixel-perfect conversion from Figma into UIKit and SwiftUI components, MVVM-C, SPM modularization (Core and Features modules), Core Data, Core Animation, Combine; AVFoundation (AVAudioSession, AVAudioEngine, AVPlayerNode, AVAudioPCMBuffer, etc.)

- **Software Engineer – [Uber](#) (Oct 2021 to May 2023)**

Contributed to maintenance tasks and cross-team development on three major projects serving 171M+ daily users worldwide, handling peaks during the pandemic, when Uber's grocery service needed to scale rapidly to cope with traffic spikes while ensuring a seamless user experience: (A) **Smart Picker Project** – Collaborated with the data team to build an intelligent shopping list based on user preferences, enabling more efficient item selection. Focused on preventing UI hiccups and slowness, crashes, and memory leaks, as well as managing view reuse states and animations. Validated performance with Instruments templates, and code quality through XCTests and screenshot tests. The feature launched bug-free and performant, meeting all business goals. (B) **Login Redesign Project** – Complete UI overhaul of the login flow. Modularized the login flow, applied SOLID principles, unit and screenshot tests, and validated performance with Instruments templates. (C) **Picking Flow Redesign Project** – Redesign of the picking flow, including new scenes and updated business logic.

Stack: Swift, VIPER, SOLID and Design Patterns (documented with UML modeling); Datadog, Core Data, XCTest, Core Animation, concurrency with GCD and swift structured concurrency with async/await, Tasks, and @MainActor; code reviews and mentoring.

- **Middle iOS Engineer – GFT Technologies (Jan 2020 to Sep 2021)**

Developed new digital banking features for institutions such as Banco Original (loan capital flow) and BTG Pactual Investment Bank (cryptocurrency purchase flow). Mentored junior developers through pair programming. Led feature implementation while collaborating within Scrum teams, and enhance code quality through XCTests and screenshot tests

Stack: Swift, View Code and storyboards, MVVM-C, MVC, Codable, CocoaPods and Carthage, RxSwift, Git, RESTful APIs. SOLID and Design patterns.

- **Junior iOS Engineer – PlayPet, Automatic Pet Feeder (Nov 2017 to Jan 2020)**

Integrated embedded IoT systems (such as balance sensors and cameras) into the app. Performed modularization and migrated the networking layer from AWS to Firebase (GCP). Developed new features and MVPs for validation. Released new app versions to app store.

Stack: Swift, Objective-C, AWS, Python, JavaScript, RxSwift, RxCache, MapKit, SwiftMQTT, Google Cloud Platform, Git (Bitbucket). CI/CD with fastlane and CircleCI. VideoToolbox and AVFoundation to integrate the camera SDK. MySQL, MongoDB, Node.js, Robo3T over SSL connection. Data export with mongoexport and data analysis using Python and Matplotlib.
